In struggle against global warming.

Справка: what is the coolant? A coolant – a working body which participates in the refrigerating

Cycle, absorbing heat from bodies

With low temperature to transfer to its bodies with more high temperature. In the evaporator of the conditioner the coolant passes in a gaseous state, selects heat at environment and cools air. In the condenser the coolant passes again in a liquid state, giving to warmly street air.

The

reasons of transition on new хлад. Agents R410

A:: Conditioners Neoclima.

Neoclima the certificate 1.

As have shown scientific researches, хлорфторуглероды, getting to an upper atmosphere, promote destruction of an ozone layer of the Earth. It leads to the raised penetration of ultra-violet radiation to a surface of the Earth having destructive influence on a human body and an ecological situation as a whole.

Let's save up ozone with conditioners Neoclima on 410 freon.

According to the United Nations Environmental Program in 1987 the Montreal protocol on substances

has taken effect «,

Destroying an ozone layer », providing gradual curtailment of production and consumption хлор.фтор.углеродов. Them gradually replace new хлад. Agents R 407C and R 410A, not containing chlorine and not destroying ozone. Ozone – destroying activity хлад agents is estimated by size озон.разрушающего potential which can accept values from 0 (for озон.безопасных хлад agents) to 13 (for ozone destroying).

Engineering - technical base Neoclima

Engineering - technical base Neoclima includes system R&D, by means of this system development and testing of new samples, and also improvement of existing models of conditioners and сплит systems is regularly conducted.
